1. Administrator (ADMIN)

The administrator manages user accounts and monitors the system. This role creates accounts together with the matching profile record for students, supervisors, and coordinators. It activates and deactivates accounts and views the audit log. It works mainly with the users and audit_log tables. It does not take part in the OJT workflow itself. The intended database role is ojt_admin, which is not a superuser and can read, insert, and update users and read the audit log.

2. Student (STUDENT)

The student is the person who undergoes on-the-job training. A student browses partner companies, applies to one company, submits each required document, records daily attendance, and views the personal placement and evaluations. A student can see and change only their own records. The intended database role is ojt_student, which can read companies, requirements, placements, and evaluations, and can read, insert, and update applications, requirement submissions, and attendance.

3. Academic Supervisor (ACADEMIC_SUPERVISOR)

The academic supervisor represents the school and checks the student's compliance. This role verifies or rejects submitted requirements, verifies attendance records, views placements and evaluations of assigned students, and marks a placement as completed once the required verified hours and a passing evaluation are reached. The intended database role is ojt_academic_supervisor. It has read access to the related tables and column-level update access only to the status, remarks, and verification fields of requirement submissions, the verification flag of attendance, and the status of placements.

4. Company Supervisor (COMPANY_SUPERVISOR)

The company supervisor represents the host company and supervises the intern at the workplace. This role views assigned interns, records and verifies attendance, and evaluates interns with a score from 0 to 100 and written feedback. A company supervisor sees only the placements assigned to the supervisor's own profile. The intended database role is ojt_company_supervisor, which can read companies, placements, and students, and can read, insert, and update attendance and evaluations.

5. OJT Coordinator (OJT_COORDINATOR)

The coordinator manages the program for the school. This role approves or rejects student applications, adds partner companies, and views placements. Approving an application creates the placement and assigns a company supervisor and an academic supervisor with the dates and required hours. Approval is allowed only when all mandatory requirements of the student have been verified. The intended database role is ojt_coordinator, which can read, insert, and update applications, placements, companies, and company supervisors, and can read students, requirements, attendance, and evaluations.
